PRESENTATIONS REQUESTED BY RAP

Documenting the Impacts of Sea Star Wasting Syndrome (Karah Ammann/UCSC)

- Trend: Lesion to mush 4-8 weeks
- Sea Star Wasting Syndrome (SSWS) first showed up in WA during Spring 2013
- How does event differ from previous events?

- Not associated with El Nino
- Continuing through winter
- Geographic extent much broader
- Previously only 2-3 spp; now 20 spp.
- Long-term Sea star surveys (PISCO, MARINe, BOEM)
 - Radius measured
 - Disease category assigned
- Citizen science data included
- Intertidal and subtidal affected (different spp being monitored)
- Tracking map available at: www.seastarwasting.org
- Abundance and size monitored
- Observed arm regrowth/healing
- New recruits and juveniles (<25 mm) at some sites
- Created juvenile sea star observation log
- Part of the story...new paper by Hewson et al. 2014: densovirus associated w/SSWS and mass mortality
 - Densovirus (water-borne) previously present in historic collections
 - Encounter rate of densovirus probably hasn't changed over time
 - Likely a complex interaction; other stressors
 - Other organisms carry densovirus (e.g., urchins)
- What's next?
 - Continue monitoring of sea stars and other affected echinoderms (carriers, no symptoms)
 - *Pisater ochraceus* is basis of keystone species concept, SSWS has potential to dramatically alter rocky shore community
 - Impact of SSWS on community needs to be assessed
- Demonstrates monitoring data is important for non-question driven science

Monterey Bay Acoustics Group Update (DeVogelaere)
